

A Look at Mobile Device Usage Among College Students

Shimon Sarraf
Jennifer Brooks
James Cole
 National Survey of Student Engagement
 Indiana University Bloomington
 AAPOR 69th Annual Conference
 May, 2014

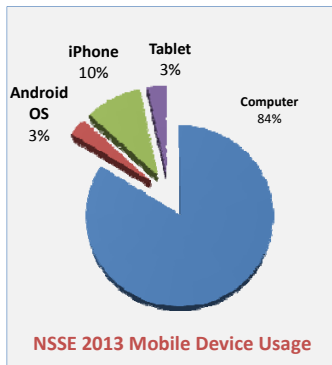

Introduction & Purpose

- Widespread adoption of mobile technologies has dramatically impacted the landscape for survey researchers (Buskirk & Andrus, 2012), and those focusing on college student populations are no exception.
- Hanley (2013) reported 92% of college students used smartphones to send and receive email messages.
- This study investigates smartphone usage among various college student demographics, and the impact this technology is having on one large survey project.

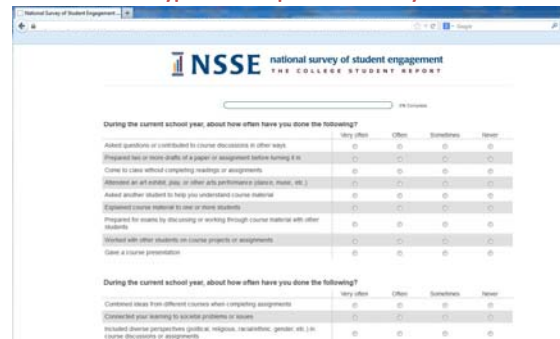

National Survey of Student Engagement

- NSSE aims to understand the curricular and co-curricular engagement of first-year and senior college students. 100+ survey items.
- Since 2000, ~ 4.5 million students from about 1,500 US and Canadian institutions participated.
- Formatted for “computer” though increasing numbers use smartphones to complete (2011: 4% / 2013: 13% / 2014:~18%).

NSSE on Smartphone

Research Questions

- 1) Are there differences in respondent characteristics between smartphone and computer respondents? By smartphone type (Android OS/iPhone) as well?
- 2) Are there differences between smartphone and computer respondents in terms of a) completion rates, b) missing survey items and c) survey measures?

Sample & Variables

Sample

- NSSE 2013 (568 US schools)
- About 2 million invitations sent followed by up to 4 reminder messages
- 30% average institution-level response rate; partial respondents included in numerator
- 334,808 first-year and senior respondents

Variables

- Device type
 - Computer (Mac/PC)
 - Smartphone
 - Android OS
 - iPhone
 - Tablet
- Demographic characteristics
- Engagement Indicators
 - Used to estimate differences in survey estimates

Respondent Results

Are there differences in respondent characteristics between smartphone and computer respondents? By smartphone type (Android OS/iPhone) as well?

Respondent Results: Sex

	Computer (%)	Smartphone (%)	Smartphone	
			Android (%)	iPhone (%)
Female	64	65	61	66
Male	36	35	39	34

Unless otherwise noted (*), all differences between computer and smartphone categories are statistically significant using column proportions z-test with Bonferroni adjustment.

Respondent Results: First Generation College Student

	Computer (%)	Smartphone (%)	Smartphone	
			Android (%)	iPhone (%)
First generation	46	48	56	45~
Non-first generation	54	52	44	55

Unless otherwise noted (*), all differences between computer and smartphone categories are statistically significant using column proportions z-test with Bonferroni adjustment.

Respondent Results: SAT/ACT Score

	Computer (%)	Smartphone (%)	Smartphone	
			Android (%)	iPhone (%)
1,000 or lower	30	37	39	36
1,001 - 1,200	39	41	37	42
1,201 - 1,600	31	23	24	22

Unless otherwise noted (*), all differences between computer and smartphone categories are statistically significant using column proportions z-test with Bonferroni adjustment.

Respondent Results: Age

	Computer (%)	Smartphone (%)	Smartphone	
			Android (%)	iPhone (%)
19 or younger	33	35	27	38
20 - 23	38	40	36	41
24 - 29	10	14	17	12
30 or older	18	11	19	10

Unless otherwise noted (*), all differences between computer and smartphone categories are statistically significant using column proportions z-test with Bonferroni adjustment.

Respondent Results: **Grades**

	Computer (%)	Smartphone (%)	Smartphone	
			Android (%)	iPhone (%)
A or A-	52	46	44	47
B or B+	36	39	39	39
B- or lower	12	15	17	14

Unless otherwise noted (*), all differences between computer and smartphone categories are statistically significant using column proportions z-test with Bonferroni adjustment.

Respondent Results: **Race/Ethnicity**

	Computer (%)	Smartphone (%)	Smartphone	
			Android (%)	iPhone (%)
Asian	6	6	5	6~
Black/African American	10	10~	15	8
Latino	9	12	14	11
White	72	71	64	73

Unless otherwise noted (*), all differences between computer and smartphone categories are statistically significant using column proportions z-test with Bonferroni adjustment.

Survey Results

Are there differences between smartphone and computer respondents in terms of
 a) **completion rates** b) **missing survey items**
 and c) **survey measures?**

Completion Rates by Device Type

Discussion/Implications

Research Question #2: Survey Results

- Completion Rates
 - Big rate gap between computer and smartphone devices that cannot be ignored. Why does Android OS show a higher rate than iPhone?
 - Additional evidence that tablet user experience is extremely similar to larger screen computer users.
- Missing Survey Items
 - Driven by survey break-off, not item non-response.
 - Very meaningful differences exist between computer and smartphone respondents for the last 2/3 of NSSE, ranging between 15% and 25%.
 - Differences exist earlier on in the survey, but not as striking.
 - **Mobile optimization experiments necessary for NSSE, and probably others:** important to short surveys but critical to long ones that can't be shortened.
- Survey Responses
 - Good news: no meaningful differences, though unknown at the item level.
 - Results are consistent with several other studies (Peytchev & Hill 2010, Mavletova 2013, DeBruigne & Wijnant 2013).
